When your soon-to-be ex-employee is about to take your confidential company data with him

EXIT

SecuriSync®
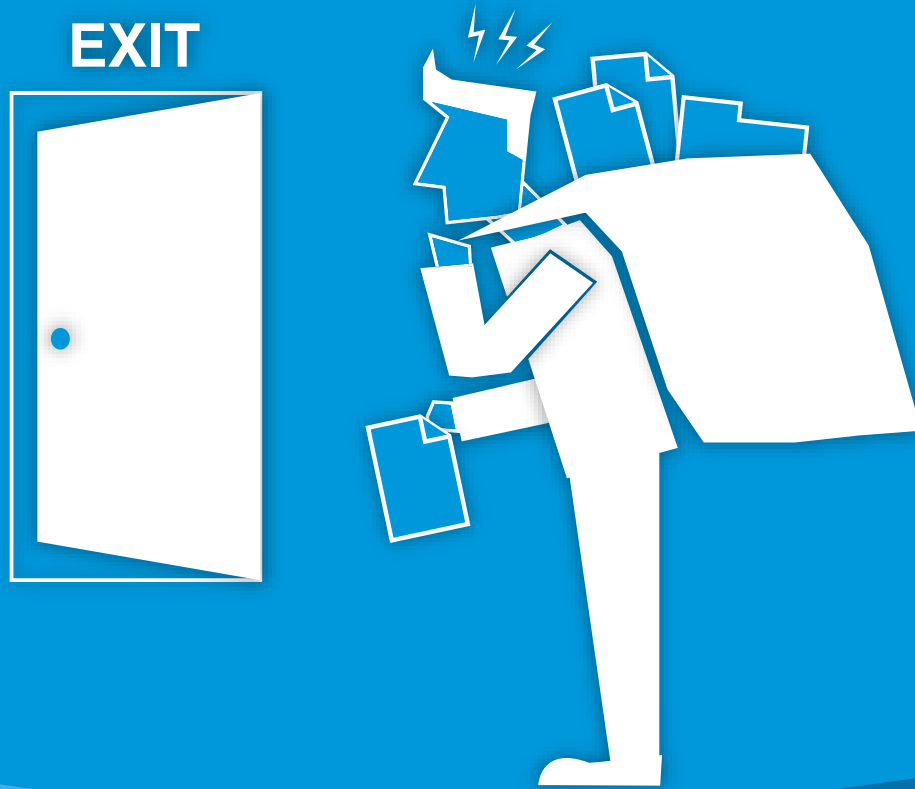

Advantage #3:
Full control over access to files
Five tips to ensure your users never lose another file

It's a startling statistic: 88% of ex-employees retained access to the file sharing services they used at their old jobs, opening their former employers up to a number of potential risks, including compliance failures, data breaches, malicious attacks on data and reputations, and the loss of intellectual property.

With SecuriSync® by Intermedia, the all-in-one automated backup, file sharing and collaboration solution, you can mitigate the potential problems – whether intentional or not – posed by former employees and gain full control over access to private corporate information.

1 Make the corporate file management solution as user friendly as consumer apps

If it requires even marginally more effort – like logging into a VPN – than consumer file sharing services, users won't use it. Data will be stored outside corporate control, and when employees move on, access to that data moves with them. You must provide a file sync and share service that's simple, automatic and easy to use but enables IT to govern access privileges.

2 Deter insecure file sharing practices

Data breaches are much more likely to occur when users turn to personal devices or consumer-oriented services to share files. SecuriSync lets users transfer files securely both inside and outside of the company, while managing access – that can easily be revoked when someone leaves – at all times.

3 Protect against data loss

One day, an ex-employee casually purges her personal cloud storage accounts, and suddenly you've lost the only copy of all her work. When users are connected to SecuriSync instead, automatic backup and version control keep data from being lost if files are accidentally or deliberately altered.

4 Exert control

SecuriSync provides IT administrators and business managers with the ability to manage users, devices, policies, files and sharing activities, including full access to end-user content and the ability to adjust permissions at a granular level.

5 Claw back the data

SecuriSync's remote wipe capabilities can ensure that sensitive data is removed from mobile devices, home PCs and any other employee device.

SecuriSync is an easy-to-use file management service, which also helps secure and manage your critical business data. SecuriSync enhances traditional file sync and share by adding real-time backup and restore capabilities. It integrates with Exchange, Office 365, Outlook, Office and existing file servers and is backed by Intermedia's 24x7 phone support and 99.999% uptime SLA.
